

SUPPORT ANIMAL RESEARCH

This April, celebrate the unsung heroes of the fight against SARS-CoV-2 and the humans that look after them

- Biomedical research with animal models is essential for developing strategies to treat and prevent COVID-19.
- Understanding the physiology of the viral infection and transmission helps identify targets for new therapies and vaccines.
- Pre-clinical trials in animals are required to demonstrate safety and efficacy before clinical trials in humans.
- Every day, at CU Anschutz and across the country, research technicians, support staff and veterinarians are protecting the health and welfare of lab animals; the foundation of high-quality biomedical research.

END COVID-19

Biomedical Research Awareness Day April 16, 2020
